

Meeting Number: 15

Date and Time: 12/05/2026 – 16:00.

Present:

Hannah Arnold

Max McGill

Rachel Kirkham

Chris Mead

Items for discussion:

Deadline submission – Full transparency on the progress of uploading to the group repo all the 2d designs, all 3d designs, any relevant photos and finally, full transparency discussing how each person did their part of the project, whether there were any hiccups that needed to be adjusted or addressed. And whether there would be something different they could do in the future. Discuss anything that might have been missed during the 2nd semester.

Record of discussion

Balraj - Animation and upload if possible latest Thursday. As a backup.

Max - Upload any versions of the mechanism to show progression. Is aware of there needing to be an STL of each stage uploaded to the git repository to give access to other members and show a history.

Hannah - Upload any versions of the base including pictures when able (latest tomorrow).

Rachel: Drop of hinges tomorrow for Hannah and check on the print progress.

Chris: Finish any Edupack uploads whether pictures or program.

We all could help each other out explaining how the progression of each of their parts of the project went to make sure we are all on the same page with how each stage was done. Any issues they had and what they would do differently next time.

Need to put something regarding eco sustainability - Rachel mentioned that using PP was more beneficial as it can be recycled easier than silicone as silicone needs to be sent to a place that specialises in it. Silicone is no longer a resource we can use due to time constraints and expense by the university. A workshop could not be organised so we went with PP as it can be printed at the 3D factory. PP lasts longer than PLA and is hydrophobic, chemical resistant and impact resistant.

Wood was used which isn't hydrophobic as a last resort due to time constraints and resources with lack of time to get budget approved however it can be made hydrophobic by coating the wood with specific oils 3 times. PLA was used due to lack of resources in the 3d factory their supply was too old,

and delivery would take too long but, in the future, the cheapest and best material selection would be PP.

Anyone struggling with the Git Repository has been informed to contact their fellow teammates for help.

Update the spreadsheet to reflect that 0% of the university funds we're used for this project as Rachel has paid for her models to be printed, Electronics if used will be provided by teammates that already have some to donate, and the base is from scrap wood found at B&Q freebee bins in the entrances. The spreadsheet will show that the model is the property of the students instead. The spreadsheet will also reflect who donated what so that they may get back those donations if they would like them back.

We have sent an email out to our module leader in regards to some questions on our project to complete our websites, awaiting response.

Action No.	Action Required	Success criteria	By When	By who
1.	Animation and upload.	50/50%	14/05/2026	Balraj
2.	Upload all versions of mechanism.	50/50%	13/05/2026	Max
3.	Upload any versions or photos of the base.	100%	14/05/2026	Hannah
4.	Check print progress of base model.	100%	13/05/2026	Rachel
5.	Finish uploading edupack research.	100%	14/05/2026	Chris
6.	After waiting on response from our module tutor, we will all continue finalising website.	100%	15/05/2026	ALL
7.	Assembly will be decided on Thursday based on how much print progress has been done on the mechanism and base.	100%	14/05/2026	ALL
